The Need for Data Centre Design and Management Training

Most legal driver license holders are not suitably qualified to race a high-performance vehicle on the track or in a rally. Specialist drivers, due to their skills, are assessed differently than the ordinary road user because they are required to have specialised skills. These drivers are trained for their role and they must gain experience over a period of time. The same goes for their high performance vehicles. Huge amounts are spent on designing, developing and building these cars. If the driver is not suitable to handle such a vehicle then the risk of an unsuitable driver actually increases the overall risk of him/her driving the vehicle itself.

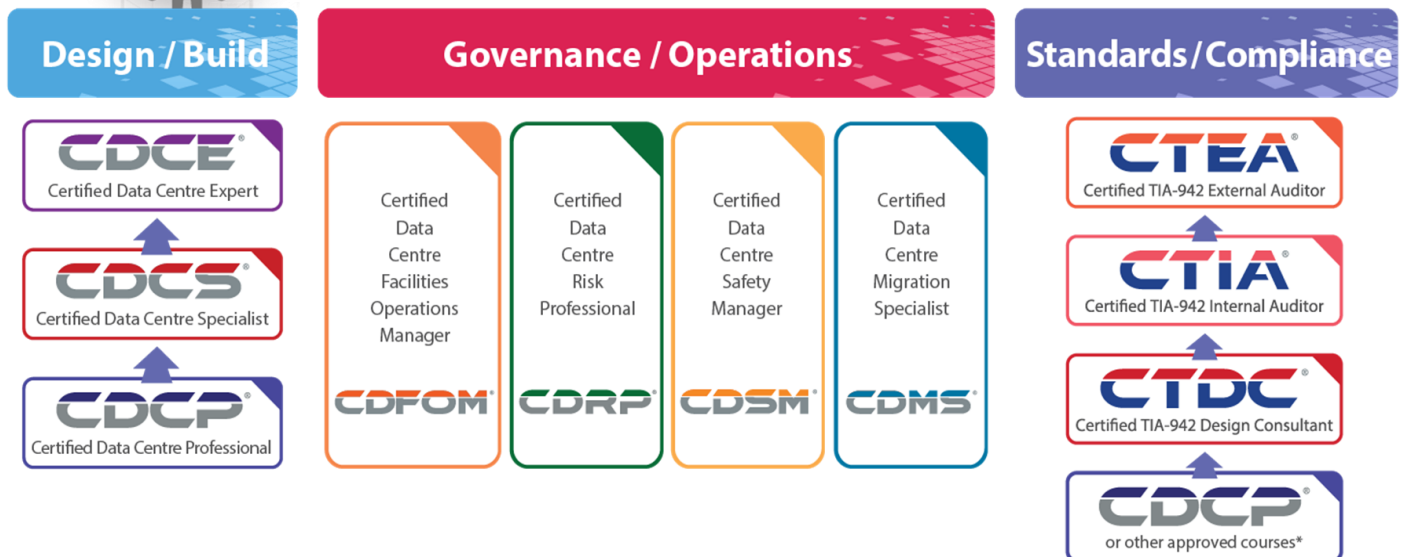

This same principle applies to people who design and build mission critical data centres. Huge investments are made to design and build of mission-critical data centres. It is important to have suitably qualified specialists who are also experienced in mission-critical environments – those who have a verifiable track record of success. The same goes for those operating and managing mission-critical environments but everybody does not have suitable credentials and experience. Sadly, the amount invested in achieving operational excellence and management of such sites is usually much lower that it should be, especially when compared to the value of the data centre assets under management and the annual total cost of operations.

Our data centre training courses are developed by highly specialised and globally experienced subject matter. It is this type of training that provides you and your mission critical team with the relevant foundation and principles to better deliver on their mandate within any data centre environment.
